Indian Food Explorer

Tabs

The dashboard allows users to explore Indian cuisine through multiple visualizations. Users can compare ingredients between different dishes using a Venn diagram, analyze relationships between various food attributes per category (like cooking time, preparation time by region) through an interactive scatter plot, visualize category distributions via a heatmap, and understand relationships between different food characteristics (like diet types, courses, and regions) through Sankey diagrams. The dashboard uses data from an Indian food dataset that includes information about each dish's ingredients, preparation and cooking times, dietary classification, flavor profile, course type, and regional origin. Users can dynamically adjust the visualizations using sidebar controls, making it easy to discover patterns and relationships in Indian cuisine.
